A Little Bit About Koozai:

Koozai are a multi-award winning digital marketing agency.

We're one of the UK's fastest growing technology companies having been ranked 23rd in the Deloitte Technology Fast50.

We help businesses connect with their customers online – providing a range of industry-leading services from Organic Search Engine Optimisation (SEO) and Pay Per Click (PPC) Management to Link Building, Social Media and Brand Management.

We thrive on building long-lasting client relationships and delivering true value for money. We're passionate about what we do - and that shows in our work.

No lengthy contracts, just world class Digital Marketing. Koozai will help you build your brand online and achieve ROI that can be clearly measured against your bottom line.

How To Get In Touch:

If you would like to get in touch with us, please visit our website (www.koozai.com) or use one of the methods below:

About The Author:

Laura Phillips has experience of SEO, PPC and Social Media both in-house and within an agency environment. Having worked across a variety of industries from travel to law, and retail to education she is always looking for new and innovative ways to improve the search and social visibility of her clients across all platforms.

Additional content provided by Samantha Noble and Dean Marsden.

About This Whitepaper

If you are looking to get more conversions without necessarily gaining more traffic then Conversion Rate Optimisation is the best place to begin. This guide will give you the basics of building a highly effective landing page, showing you how to find areas for improvement, and how to maximise their potential for conversion.

What Is Conversion Rate Optimisation?

A large number of websites spend a lot of time and energy focusing on their traffic. There is a widely held belief that if you can get traffic to your site then conversions should naturally follow. Sadly for most, this is not the case. You may be getting vast amounts of traffic to your site, but what can you do if conversion numbers do not meet expectations?

Conversion rate is one of the most important statistics for any online business. It's about getting the most from your customers, maximising their understanding and desire to convert, and countering any and every bump in the road that may stop them doing so.

Step 1: Review Your Existing Pages

The easiest way to find potential improvements for your landing pages (or indeed any part of your site) is through analysing what you already have and testing it. Whether you are building a brand new site or looking to improve on an established one, testing and re-testing is crucial.

What Are You Trying To Achieve?

Start by thinking about your objectives:

- Why am I testing this page?
- Who is my target audience and why?
- What is a good key performance indicator (KPI) for this page?
- What is this landing page trying to get users to do?
- What course of action is it trying to promote?

Identify your goals for testing and give consideration to the expected outcome. It is easy to get caught up with passive goals which are easier to achieve but don't actually create actions, for example, total traffic. High levels of traffic are good; but only if they are converting. You also need to measure actions from those you are trying to influence.

Try to aim for one goal per page. If an action is worthy of being a goal, it needs its own landing page to give maximum opportunity to convert and the least chance of distraction from the goal. For example Spotify focuses on having you try their premium service:

Step 2: Decide On The Type Of Test

A/B Testing

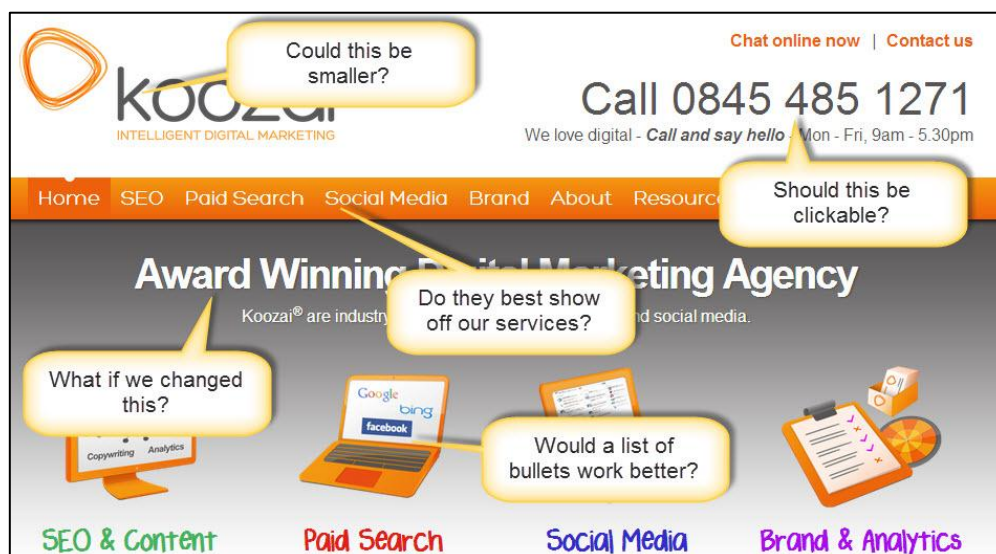

A/B testing (aka split testing) is simply where you test two versions of one page element. For example, you may wish to design a home page with a light blue background and a dark blue background alongside each other to see which performs the best. Once the test has been run and the most successful page established, this may become the new default, which can then be tested against another, for example a grey background. A/B testing involves constantly testing two variations of one page element to find which is most beneficial to the site, giving very specific results.

Multivariate Testing

Multivariate testing allows you to compare a number of factors across a page or pages to find the best possible combination. You may wish to test various headlines, colours, button locations, images, price points or any other aggregations of elements to find which performs best for your predetermined goals. Start by listing the elements you wish to test, for example, headline includes/excludes the word 'Free', button size large/small, and image top/bottom.

The versions and tests you can run are essentially infinite, providing broader results than A/B testing. That's why if you're looking to run a test it's often far better to use Multivariate testing and to create a new page that meets your core goals rather than just a simple change such as colour switches.

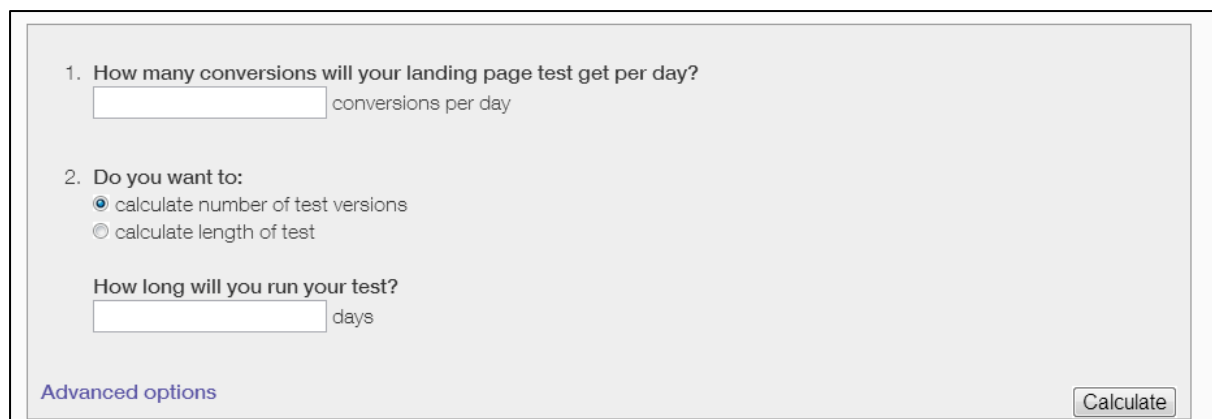

Step 3: Set Quantitative Goals

We now need to consider some of the fundamental aspects of our test to make sure goals are realistic and easy to track:

How Long To Test For

Consider the timeframe you will need to run the test. If you fail to define clear parameters, your results will be hard to quantify. Think about how many conversions you get on a daily/weekly/monthly basis and how many you need to achieve conclusive results.

Marketo have created a [Landing Page Calculator](#) to estimate the time period and/or number of variations you could run based on the number of conversions the site achieves on a daily basis.

The screenshot shows a web form titled "Landing Page Calculator". It contains the following elements:

- Question 1: "How many conversions will your landing page test get per day?" with a text input field and the label "conversions per day".
- Question 2: "Do you want to:" with two radio button options: "calculate number of test versions" (selected) and "calculate length of test".
- Text: "How long will you run your test?" with a text input field and the label "days".
- A link labeled "Advanced options" in blue text.
- A "Calculate" button in the bottom right corner.

How To Check Your Results Will Be Accurate

Statistical significance allows you to accurately distinguish between naturally occurring patterns and those that happen by chance. This is hugely important, you need to know your results are accurate before implementing any changes or page performance may be damaged instead of improved.

Set a level of confidence that you are happy with (if you are unsure, 95% is a popular bar for confidence). Then choose one of a number of plug-ins available for Microsoft Excel (such as the [Data Analysis plugin](#)) which will tell you the sample size you will need to gain accurate results.

Step 4: Choose a Data Source

In many cases, sites will roll out landing page tests on a live site and watch the results come in. In other cases, such as a site that has not been launched yet, user testing may be carried out by small samples of invited guests. They can then test a landing page within a website by using it and recording their thoughts.

Test It Yourself

Firstly, be the customer and test the page yourself. You may think you know your site inside out, but site owners often discover stumbling blocks they didn't know of or had forgotten existed by testing the site for themselves. Navigate the page testing your predefined goals one by one. For example, if you were testing the BBC homepage you may wish to test how easy it is to navigate to the news or TV listings. Are they easy to spot? Does anything block your path such as pop ups?

Video yourself doing this and keep a running commentary of what you are doing and how you are feeling. There are many products and services available for this such as ScreenFlow or Camtasia. You may hate the idea but you will have a record of your own user experience that you can refer back to.

Heat Maps

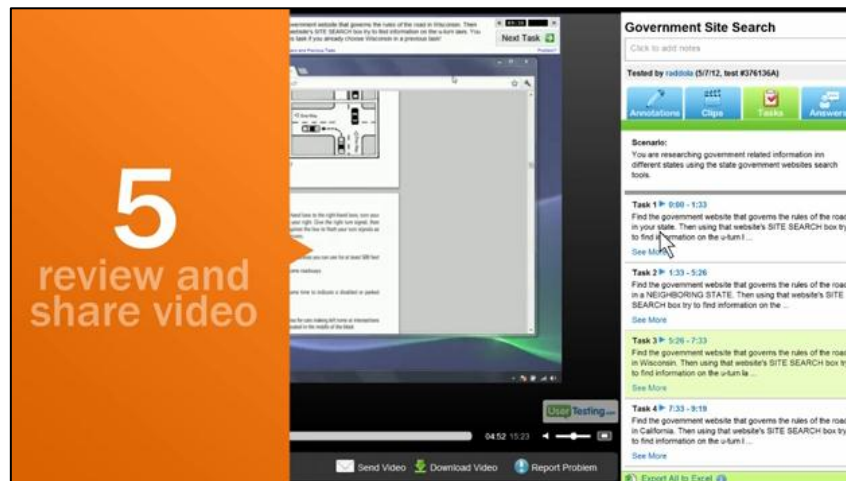

Secondly, have the page tested by anyone who can spare the time and see what issues they might have. If the same issue keeps coming up, start improving by focusing on that element of the page.

You may also wish to employ a User Experience (UX) service such as [Clicktale](#) for heat-mapping, eye-tracking. This will show you the behaviours users use when they browse your website and build up an aggregate pattern so you can spot any issues.

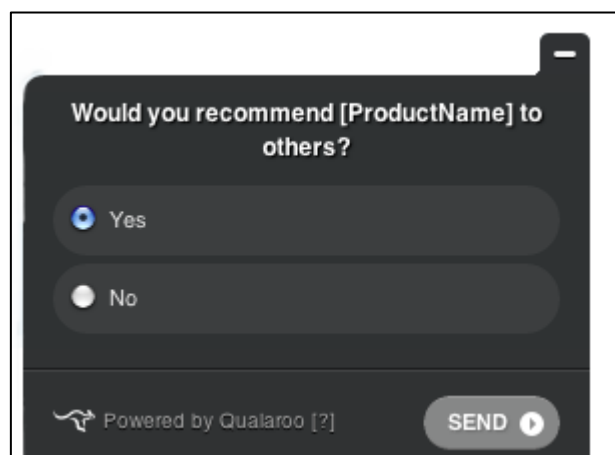

Get Others to Test for You

You could also use a full video service such as [User Testing](#) or [What Users Do](#) which allow you to create a test and define what tasks testers should complete. Once completed you will receive videos of participants with audio so you can see and hear what problems they might have found. It's important to get third parties fitting the description of your target audience to test your site. If your target audience is broad, you may wish to carry out tests using a number of different audiences.

Surveys

For ongoing feedback, you may wish to add a service such as [Survey Monkey](#), [Ethnio](#) or [Qualaroo](#) (previously KISS Metrics) to the site. These surveys can be added to any page, though most commonly they are added to the Thank You page. This creates a small pop up where you can ask for the user's opinion. Because you are requesting this information from the Thank You page, you ensure that these users are fully qualified, having already converted. You may wish to ask if there was anything that confused them, or that they found hard to find on the landing page.

Google Analytics Tracking

Within Google Analytics you can create goals that allow you to see when a user has completed a key action. You can also analyse this data to see what they did before completing the action, such as the pages they viewed. This is a great way of seeing which parts of the conversion path need improving.

Goal Completions: 529

Goal Value: £1,405.00

Goal Conversion Rate: 1.33%

This guide from Google explains how to create goals:

<http://support.google.com/analytics/bin/answer.py?hl=en&answer=1032415>

Google AdWords Tracking

If you are running paid search adverts on AdWords you should also enable conversion tracking: <http://support.google.com/adwords/bin/answer.py?hl=en&answer=1722054>. This will identify which keywords and adverts led to conversions and is the ideal way to see if your pages are meeting user expectations.

You should also run your new page through all of these tools once you've created it to see what people think.

Step 5: Advert Testing

Always keep your Ads in mind, making sure the landing page is closely tied to the Ad copy. This not only gives users the confidence that they have made the right decision by clicking, but also helps to minimise wasted clicks. If you aren't using paid adverts then it's also important to consider your Meta matches up to the pages people will land on.

For example M&M Direct have adverts for running shoes that say they are cheap:

[Up to 75% off Running - MandMDirect.com](#)
www.mandmdirect.com/Running - ★★★★★ 62,810 seller reviews
Save on **Running Shoes**; Lowest Prices Guaranteed.

The landing page then supports this by showing only running shoes, and how much the price saving is on each one:

The screenshot shows the M&M Direct website interface. At the top, there's a navigation bar with links for Home, Mens, Womens, Kids, Sportshop, Footwear, Brands, New, and Clearance. A search bar is also present. Below the navigation bar, there are promotional banners for free standard delivery, savings up to 80%, and a sign-up for great deals. The main content area displays a grid of running shoes. On the left, there's a 'REFINE BY' sidebar with filters for Gender (Womens, Mens, Boys), Brand (adidas, Asics, Brooks, New Balance, Reebok, Saucony), Product (Footwear), Sport/Fashion (Sport), Price (less than £10, £10 - £20, £20 - £30, £30 - £40, £40 or more), and Size (UK 6, UK 6.5, UK 7). The grid shows eight shoes with their names, prices, and savings. For example, the Brooks Womens Vapor 8 Stability is priced at £39.99 with a saving of £45.00. The New Balance Mens 573 Trail is priced at £34.99 with a saving of £30.00. The page also includes a 'You are here' breadcrumb trail, a '110 styles found' indicator, and a 'Sort by' dropdown menu.

Product Name	Price	Save
Brooks Womens Vapor 8 Stability	£39.99	£45.00
adidas Womens Assertion Stability	£34.99	£55.00
Brooks Junior Ghost Neutral	£14.99	£30.00
New Balance Womens WR1080	£44.99	£55.00
Brooks Womens Glycerin 8 Neutral	£49.99	£60.00
Brooks Junior Ghost Neutral	£14.99	£30.00
Brooks Womens Addiction 9	£39.99	£45.00
New Balance Mens 573 Trail	£34.99	£30.00

Step 6: Landing Page Testing

On any given page there are likely to be thousands of different variations of items that can be tested to generate results. Below we've listed some of the most important changes to investigate and while you don't need to change them all this should be a great place to start if you need inspiration:

Word and Content Tests

- Test the offer
- Long paragraphs vs short paragraphs
- Bullet points vs paragraphs
- Punctuation
- Test copy ordering on the page
- Columns – 1, 2 or 3 layout
- Test different words
- Informal / formal / attitude
- Font size
- Links – Blue and underlined
- CTA Wording

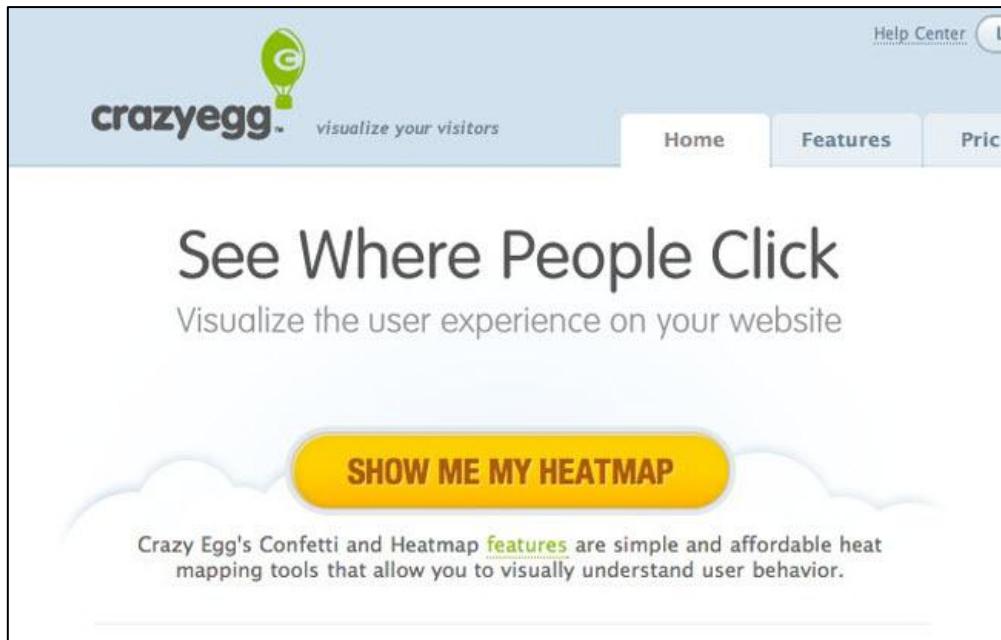

Other Things To Test

- Headline
- Image
- Call to Action: Wording / Shape / Style / Position on page / Icon / Colour / Legibility
- Layout
- Testimonials
- Content Size
- Actual Copy
- Embedded Widgets
- Coupons
- Colours
- Fonts
- Sizes
- Sales Incentives
- Number of fields on a form
- Newsletter Subscriptions
- Reviews
- More Product Details
- Shipping Info
- Shipping Pricing

Let's take a look at some of those key items in more detail:

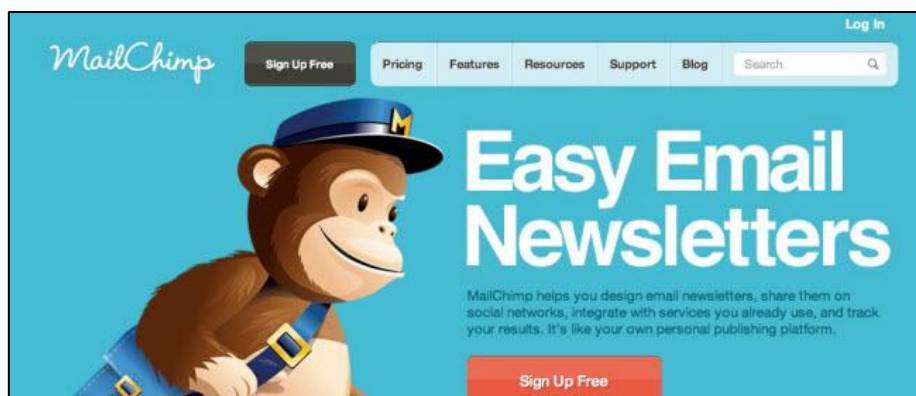

Guide Your User

Guide your user's eyes to where you want them to look with a logical, attractive design and cues such as colour contrast and arrows to take them to your call to action. The Crazy Egg Home page does this really well:

Headline

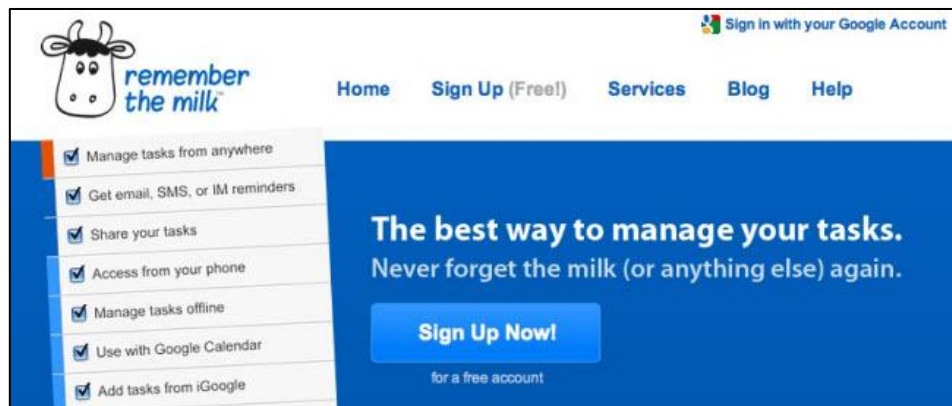

Start with a headline that feels personalised; text visitors can identify with and that provides an answer to their search query. The headline has the job of drawing the user in and making them want to read more, so make it engaging, rouse their curiosity, and give them a reason to continue. This will often be the place to include your unique selling point. For example 'Plant bulbs delivered to your door – 10% off until 5pm today'. On the MailChimp website their headline makes it really clear what they do:

Initial Content

Follow the headline with short, to the point text or bullet points to keep reading easy and the user engaged. This text should include more details of the features and benefits you offer, explaining how your product or service will benefit the user, and should be written in the same style as the headline.

Remember the Milk uses a “to do” list to explain their features, which is a clever way of showing how their product works:

Images / Videos / Diagrams

Use images to break up content and help reinforce the feel of the site. For example, technical, emotional, niche. This is the place to add your best promotional imagery or video or your product or service in use. Video has been reported to directly increase conversions by over 75% in some instances. Attractive diagrams can also be useful here, demonstrating how your offering solves a problem.

The Dropbox Homepage focuses on one big video to show their benefits.

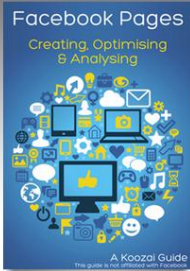

Main Content

The first paragraph should contain a brief review of major points. You also need to reveal the deal clincher early on so the user does not have time to lose interest. Think about what you would say if you were selling the product face to face. Your landing page copy should reflect this. Consider recording yourself making a pitch then compare it to your page and see what elements might be missing.

Some sites will be better off with short, easy to read pages, where others will require more information, usually where larger purchasing decisions are involved. For an example of how long pages can work to your advantage have a look at any Amazon product page. That said, if you don't have anything to say, don't say it. Endless waffle and fluff in your text will put users off. Keep editing your content, every word must have a purpose, otherwise take it out. On our Whitepaper pages we try to quickly establish what the content is about:

Facebook Pages – Creating, Optimising & Analysing

This in-depth Whitepaper includes the types of content that performs well on Facebook and how to use EdgeRank to make sure your topics get seen. You will discover:

- ✓ A how-to guide on getting started with Pages
- ✓ How to understand EdgeRank and get your posts seen
- ✓ The types of content you can upload
- ✓ Key metrics you should use when analysing your Facebook page
- ✓ The Facebook terms and conditions that you have to obey

The Offer Itself

Place your offer here with a clear call to action. Include a brief overview of the benefits, present your offer, and justify your pricing. You may also wish to include a limited time offer or other incentive to act quickly. This helps to create a sense of urgency which may motivate more users to convert. Groupon do this well:

One-Hour Swedish Full-Body Massage for £17 at Koncept Hair and Beauty (51% Off)

Buy Now!

Amount: £17.00

Discount	You save
51%	£18.00

 Buy it for a friend

 This deal can be bought in this city over the next **2 days 12:03:21**

Social Proof / Testimonials

Social proof can be very important in the conversion process. Testimonials from real people provide evidence that you are a trustworthy and quality business. The reassurance of seeing your offering be qualified by others helps users convert.

Any positive press can also be used on your landing page to further cement your value in the mind of the user, as can any guarantees or other 'peace of mind' propositions you may have associated with your product or service.

If any recognisable companies or personalities use your product or service, combine this selling point with more imagery such as their logo or photograph to provide further assurance. Firefox do a great job of showing off the number of downloads they have had and using that to encourage downloads:

Make It Easy To Convert

Overly lengthy or complicated forms are known to put users off. Focus on making conversion as simple as possible with a quick and easy to use action, no distractions such as pop ups or adverts, and a Thank You page asking for their opinion to help you further improve your landing page. We try to make the forms for our Whitepapers as simple as possible and focus them on only the information we need:

Step 7a: Shopping Cart Testing

Another vital part of a website to be tested often is your shopping cart, especially by analysing where people fall out of the process. Some of the key aspects to test are:

- Make it easy for people to pay using their preferred method (PayPal, Credit Card etc)
- Check the compatibility of payment gateways (e.g. Lloyds) on different browsers
- Test how the shopping cart renders on a mobile and tablet
- Include logos that add trust
- Gather email addresses at the start of the process, if users don't complete an order then follow-up
- Consider testimonials and reviews
- Use key phrases such as 'Fast Delivery' and 'Price Guarantee' to encourage a sale
- Review competitor shopping carts to see what they do well
- Use progress indicators, pictures and links to product descriptions
- Eliminate unnecessary steps
- Monitor user journeys through the process with the tracking software discussed earlier
- Make error messages clear so the user understands any problems they have to fix
- List a phone number in case of any problems
- Make postage costs visible on the product page so there are no surprises
- Test user registration before and after the sale

One site that does many of these items very well is ASOS:

The screenshot shows the ASOS shopping cart page with several annotations in yellow callout boxes:

- Cross promotion of other items:** Points to the search bar and navigation links.
- Time limit adds urgency:** Points to the 'SHIPPING B...' banner with 'Stock reserved for 60 minutes only'.
- Clear CTA:** Points to the 'PAY SECURELY NOW' button at the top right.
- Clear order summary:** Points to the 'ASOS Bomber Jacket With Empire Print Back' item description.
- Reminder of money saved:** Points to the price comparison showing '£38.00' crossed out and '£20.00' as the current price.
- Many payment options:** Points to the payment method logos (VISA, Mastercard, PayPal, etc.).
- Trust statements:** Points to the 'SECURE SHOPPING' and 'FREE RETURNS' sections at the bottom.
- Clear CTA:** Points to the 'PAY SECURELY NOW' button at the bottom right.

The page layout includes a header with the ASOS logo, a search bar, and navigation links. The main content area displays the selected item with its options (Colour, Size, Quantity) and a 'CHANGE DETAILS' button. The right side shows the subtotal, delivery charges, and the total cost. The bottom section features three boxes: 'SECURE SHOPPING', 'FREE RETURNS', and 'FREE NEXT-DAY DELIVERY'.

Step 7b: Form / Contact Page Testing

If you don't have a shopping cart then you'll need either a form or contact page to gather customer details. Like a shopping cart there are also factors to be considered:

- Keep reading to a minimum
- Only have "required" fields where absolutely necessary
- Have adequate shipping information and pricing information
- Ensure that the email privacy link is next to, or close by to the email request field
- Add alternative contact methods (Phone, Email, Address, Live Chat)
- Keep contact form as short as possible; the basic name, email and message fields should be enough
- Use a large, obvious submit button below your contact form
- Assure users that their contact details will not be passed on to a third party
- Include your phone number as HTML text so it can be used on Skype or easily copied
- Include your postal address as HTML text so it be easily copied
- Add Schema markup data to allow your address and phone numbers to appear as rich snippets in the search engines and elsewhere; more information at www.schema.org.
- Display a confirmation message when the page has been sent
- Test having the name, position and, if possible, a picture of the person they might be speaking to when they contact you
- Provide FAQ's to answer common questions that may cause issues

SEOMoz do many of these things very well:

The image shows a screenshot of the SEOMoz website with several callouts pointing to specific features:

- About SEOMoz**: What we do and how we got here.
- Our TAGFEE Mission**: Learn more about our core values.
- Meet the Mozzers**: Get to know the team behind the product and community.
- Contact Us**: Call us, email us, send us love, or visit our home base.
- Join Our Team**: Check out open positions at the mozPlex.
- Press & Awards**: See us in the news and download our press kit.
- Events**: Find out what's partying.
- More options / FAQ's**: Whether you have a question about your PRO account, need assistance using a tool, or you're in town and want to check out the office, we want to hear from you!
- States the brand vision**: Your community is...
- Shows the team**: A photo of the SEOMoz team.
- Use photos to add a personal touch**: A photo of the SEOMoz office.
- Lots of contact methods**: Sales questions? Dial (206) 812-2232. Billing questions? Dial (206) 812-2233. Need technical support? Dial (206) 812-2234. Our administrative... Help Team: If you have questions about your account, billing, or other issues you might encounter, please email help@seomoz.org. Sales: If you have sales inquiries, please feel free to email sales@seomoz.org. Get Social: Connect with us socially and stay up to date on all the happenings!
- Contact times**: Nobody likes long phone menus or talking to robots (no offense, robots!), so dial the appropriate number below and we'll try to connect you to the right human, Monday - Friday from 7am-5pm PST.
- Social proof**: A photo of the SEOMoz office.
- More contact methods**: A photo of the SEOMoz office.

Step 8: Collect And Analyse Test Results

One of the better ways to test pages is to use Google Content Experiments which can be accessed via Google Analytics:

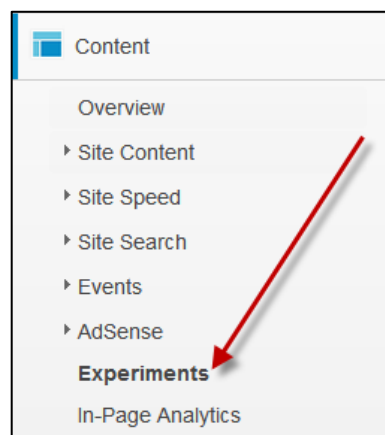

Getting Started

It is very easy to get started with a new Content Experiment and you can be up and running in five simple steps:

- Decide on which page you want to test
- Design the different variations (each one needs a separate URL)
- Choose which goal you want to improve
- Create the test
- Analyse the results

Content Experiments can be found within the Content section of Google Analytics, just one click away from your main reports.

When visiting the area for the first time you will be displayed a screen explaining a little bit about the tool and how to use it. There are some helpful guides; so if you are unsure of what to do, I would recommend checking these out first by clicking on 'learn more' in the bottom right-hand corner of the screen.

The first thing you need to do to create a test is to tell the system what page of your site you want to start with.

In this example I have added the Koozai Home page:

Experiment to improve goal conversion

Test which page design is more effective for your website visitors

Enter the URL for the page that you want to improve:

http://

[START EXPERIMENTING](#)

Which pages should I include in my experiment?

Your experiment can focus on any single page that helps visitors accomplish a specific goal:

- A landing page
- A page along the goal funnel
- Your goal page

How do I get started?

- Decide which page to test
- Design variations of that page (separate URL for each variation)
- Decide which goal conversion to improve

[Learn more](#) about Content Experiments and A/B testing

Next up, you will be asked to provide details of the first variation you want to run against your original. The variation does need to be on a different URL and I would suggest that you put all your test pages into one folder on your site called 'tests'. This way you can block the entire folder within your robots.txt as you don't want the search engines to be able to crawl the pages due to duplicate content issues.

Create a new experiment

1. Choose experiment pages

2. Set experiment options

3. Add and check experiment code

4. Review experiment

Step 1: Choose experiment pages

Experiment name:

Original Page (Control)
Original Page URL:
 ?
Dynamic URLs Supported ?
Page name:

Variation 1
Variation URL:
 ?
Page name:

If you want to test more than one page variation, you can do this from this stage too. There is a button that you can click to add another variation. If this is the first time you have played about with testing, always start small and create one variation or things may get a little confusing.

Next you need to set up your first test and choose which goal you want to add. After selecting the goal you want to work with, you need to tell Google what percentage of your visitors you want to put through the test. The higher the percentage, the faster you will be able to see the results; however, if you are making a change you may not want to put all your traffic through the test in case the change causes a negative drop in conversions rather than a positive. Basically, if you choose 100% of traffic and have your original page and one test page then 50% will see the original and 50% will see the test.

Code Implementation

In order to get the test started, you will need to add a small piece of code onto each of your test pages. Content Experiments makes it easy to either add the code yourself or send it onto your Web Developer.

NOTE – all pages taking part in the test need to have Google Analytics installed.

The code needs to be added immediately after the opening <head> tag on the original page.

Create a new experiment

1. Choose experiment pages

2. Set experiment options

3. Add and check experiment code

4. Review experiment

Step 3: Add and check experiment code

To set up your experiment, your original page will need a small amount of code added to it.

☐ I'll add the experiment code myself ?

☒ I'll send the experiment code and instructions to my webmaster ?

After you have updated your pages with the experiment code, click **Next** to validate the code, review your configuration and run the experiment.

Once you have added the code to the original page you will be taken to a new screen which checks to see that you have installed the code correctly. If you haven't you will be displayed with a message like the one below. If everything is OK and ready to go, you will see green ticks next to each page indicating that you can proceed.

Checking your pages for working code ×

Original: <http://www.koozai.com>

 **No experiment code found.**
Your original page needs the experiment code. ?

Variation 1: <http://www.koozai.com/seo/> 

NOTE: If you're sure that the pages are set up properly, you can [skip validation and continue](#) ?

Try validating again

Cancel

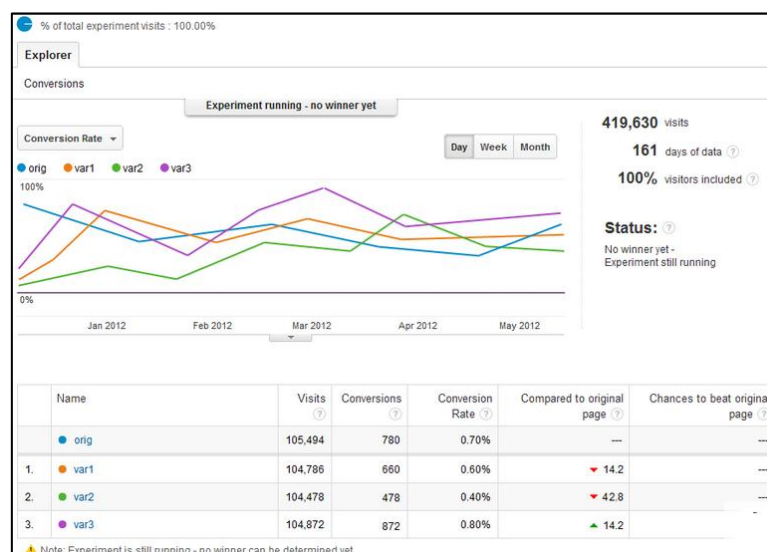

Checking The Test

You are now ready to start the test, so spend a couple of minutes reviewing what you are about to launch before hitting the go button. Depending on how much traffic your site receives and in particular the page that you are testing, this will determine how long you should run the test for. In order to see fair results there should be a good amount of visits and conversions put through the test.

Once the test is running, you can look at the results as they come in by going back to the Content Experiments section in Google Analytics. When you select the section, you will be displayed with a list of all your experiments.

All Experiments					
Notifications: Latest All					
• referer_test has finished View report • prodtest has finished View report • OrigNoGASnippet has finished View report					
Create experiment					
Experiment Name	Status	Details	Visits	Start Date	End Date
OrigGASnippet	● Running		45,115	May 9, 2012	Still running
Google Store	○ Setup	Step 3	--	--	--
TagTest	○ Setup	Ready to run	--	--	
Revalidation	● Running		419,570	Apr 5, 2012	

You can go into each test to see the results received to date and it is wise to keep checking back on your test to be confident that you are not losing out on goal conversions. When you select an experiment from the list, a detailed report will open for that experiment. In the report you can see exactly how the pages in your experiment are performing and whether one of the pages is outperforming the other. You can also see the status of your experiment from this report and if you decide to stop the test early, you can do this from here too.

Step 9: Review and Refine

At this stage you should have created new pages to test with clear goals in mind. You'll have launched the pages and tested them against each other to determine which worked best, or you'll use real user feedback to determine what they love and hate.

Now you have a winning page the next step is to reassess what worked well and to try and tweak those aspects or introduce new elements to gain further improvement. CRO is a process that never truly ends and that's what makes it so fascinating.

Thank you for reading this whitepaper and happy testing!
